Overview

Technical Data, PETRONAS EP

- Department structure
- Relationship model
- EP Data dimensions

Technical Data Management Perspective

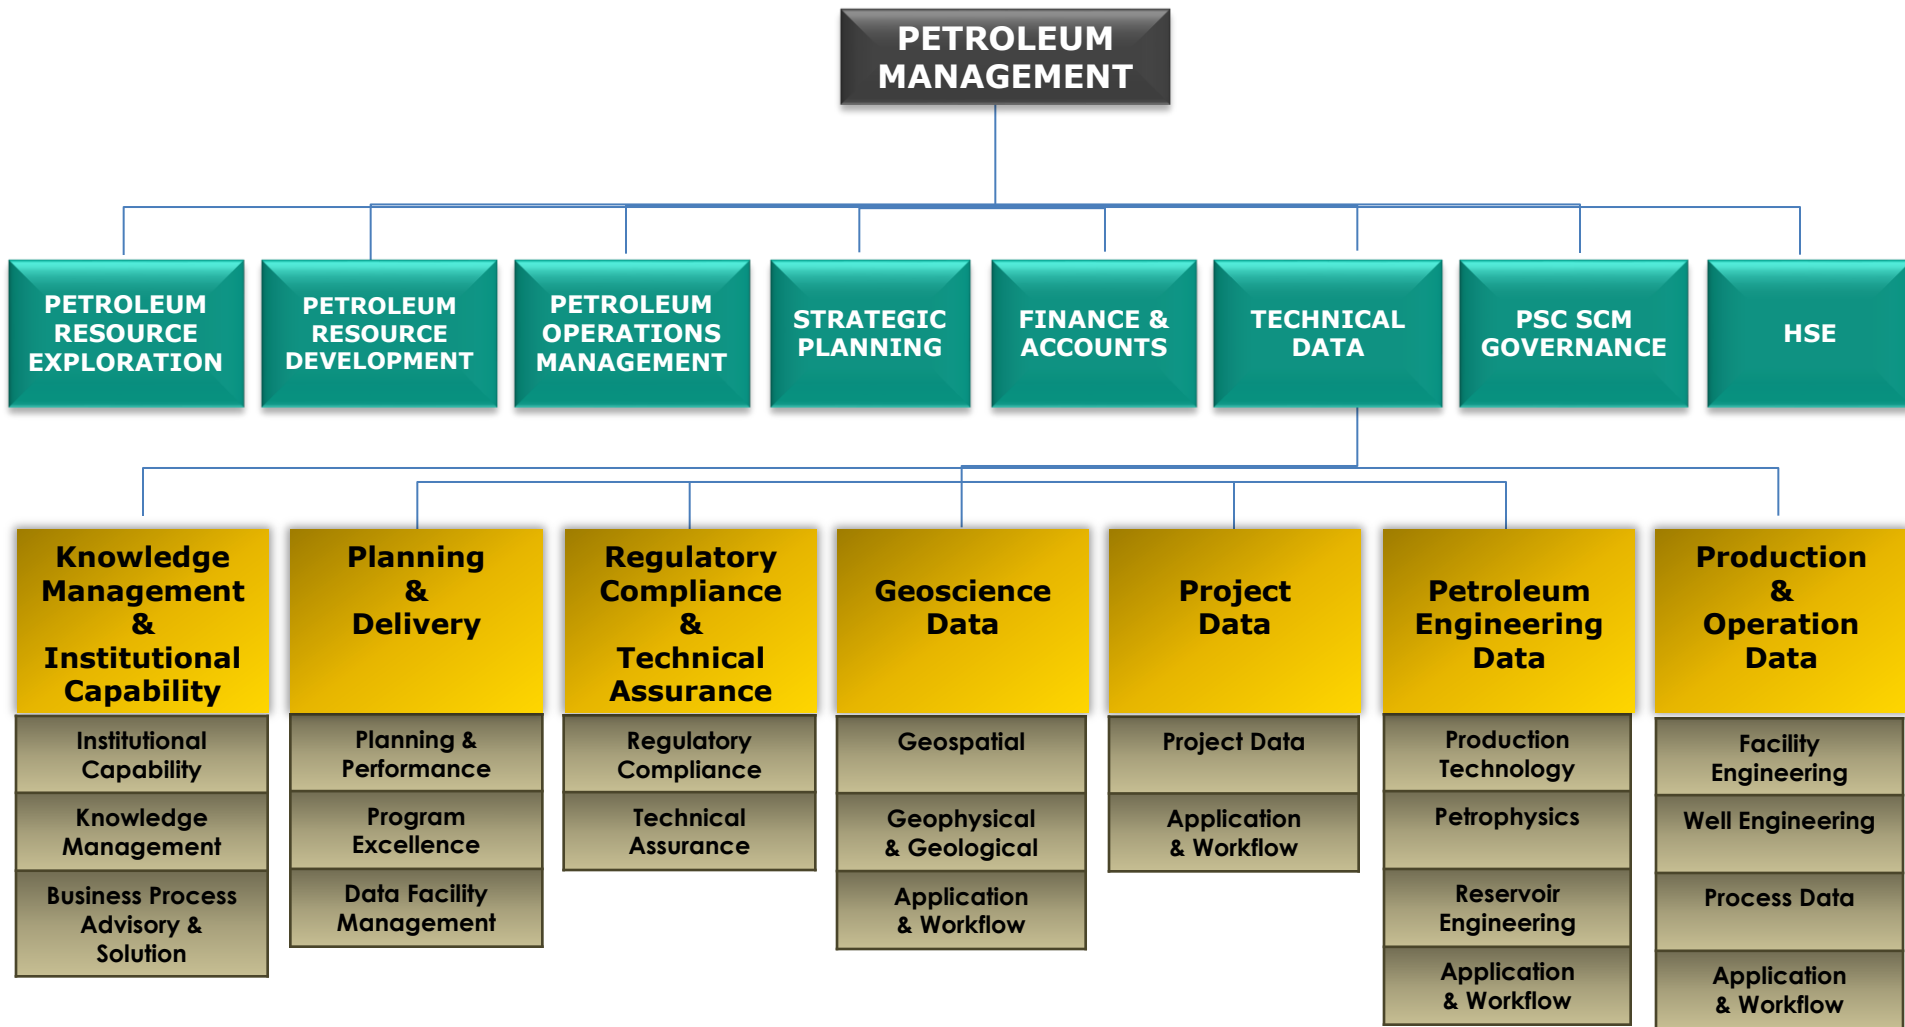

- The role of data management in value creation
- Types of data standards in EP
- What problems are we trying to solve?
- Example – Well status comparisons across projects

Technical Data Standards – The Approach

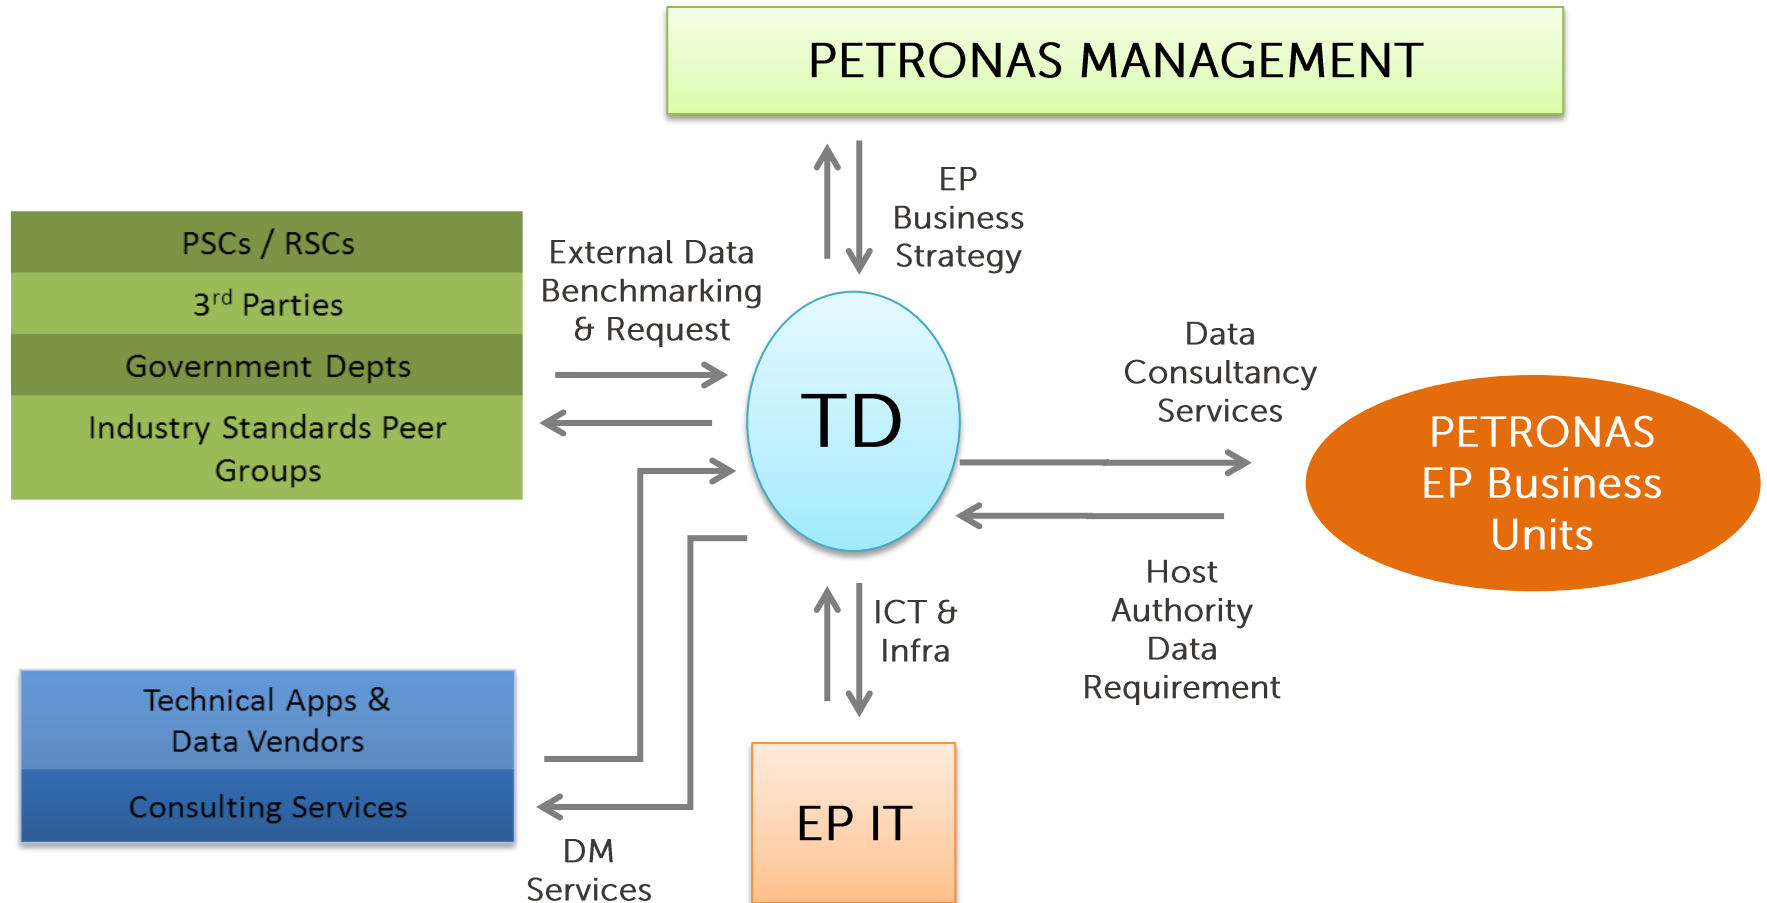

- Data management standard role - relationships
- Standards Bodies for EP
- Moving the organization towards standards
- The Triple-A approach
- Technical data standards – high level roadmap

Technical Data was formed to elevate functional excellence and delivery discipline of data management

Technical Data Department relationship model

Background – PETRONAS EP data dimensions

- ~ 1,000 2D/3D seismic surveys
- ~ 12,000 wells
- All EP data types

- >766 active projects
- ~ 159 ventures in 25 countries
- ~ Average 100 wells drilled per year

Measured Data

> RM35 Billion investment on data acquisition

Interpreted (Result) Data

Subsurface understanding which has direct impact on business decisions

- > 1,000,000 media
- > 700,000 technical docs
- > 3,500 TB disk space
- >120 data bases

Dimensions of PETRONAS EP Data Management

- >250 specialized technical applications (Multiple disciplines & related application workflows)

Media & Corporate DBs

Media, hardcopies and Geosamples

Tools (Technical Software Application)

> RM1.2 Billion investment

End Users

> 400 geoscientists and engineers from all technical domains in E&P

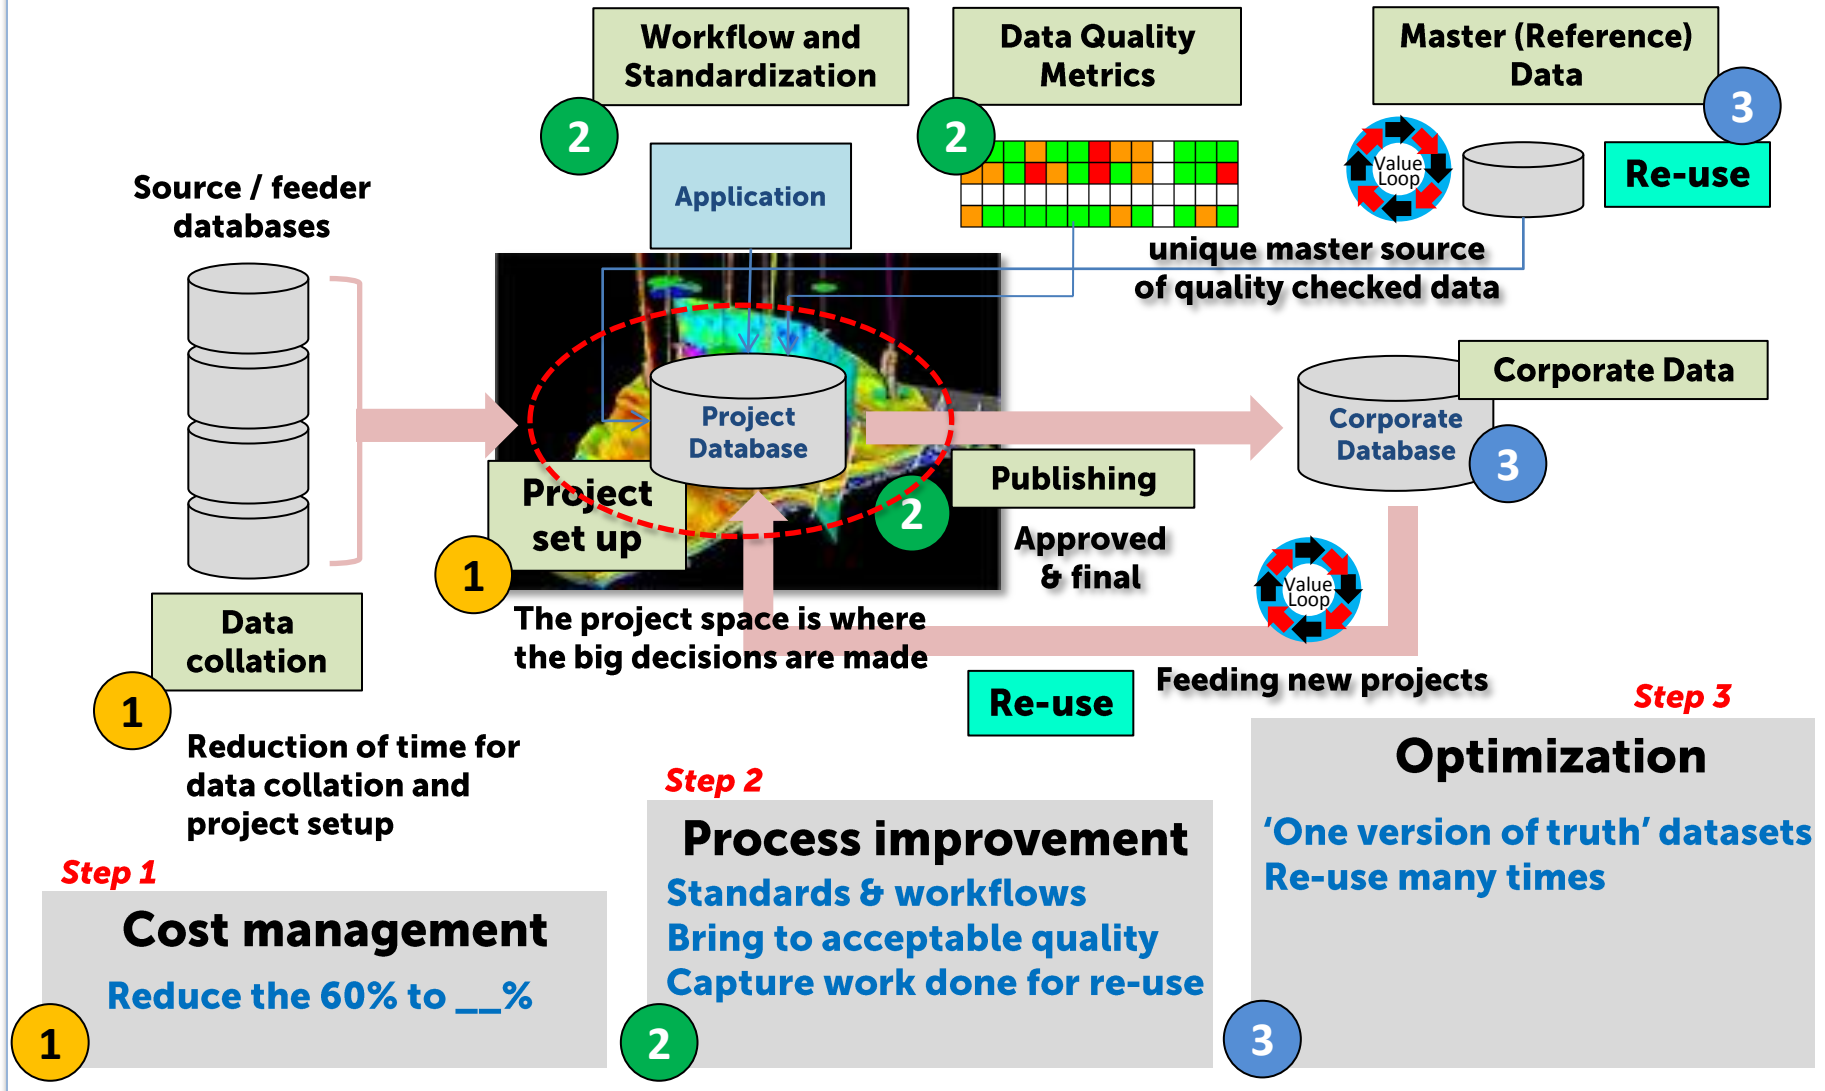

External Stakeholders

Potential investors, PSCs, government agencies, universities

Role of Data Management in Value Creation

Previous studies : Geologists spend up to 60% of their time looking for & quality checking data for their projects

Types of standards in EP

TYPES

Examples

Category

- Reference data
 - Naming conventions
 - Datatype standards
 - Database footprint stds
 - Data transfer standards
 - Data quality standards
 - Compilation standards
 - Industry standards
- Country codes, symbols, abbreviations
Wells, horizons, projects, logs
Well logs, velocity
Openworks, Petrel
Data migration, integration, workflows
Business rules
Fileplans, Completion logs, TRAPIS
ISO, WITSML, PRODML

DATA STANDARDS

- Standard applications

APPLICATION PORTFOLIO MANAGEMENT

- Standard Configuration
- Standard architecture
- Standard infrastructure
- Standard desktop environment

ARCHITECTURE STANDARDS

What problems are we trying to solve?

- Over the past 20 years in PETRONAS, many data initiatives have been carried out and documented
- Several technical data standards reports are in our archives
- We do not have a full picture of what we have
- Implementation of standards is ad hoc and very much dependent on individual projects
- Sustainability is questionable
- Technical data standards governance is an ongoing issue

Example – Well status comparisons across projects

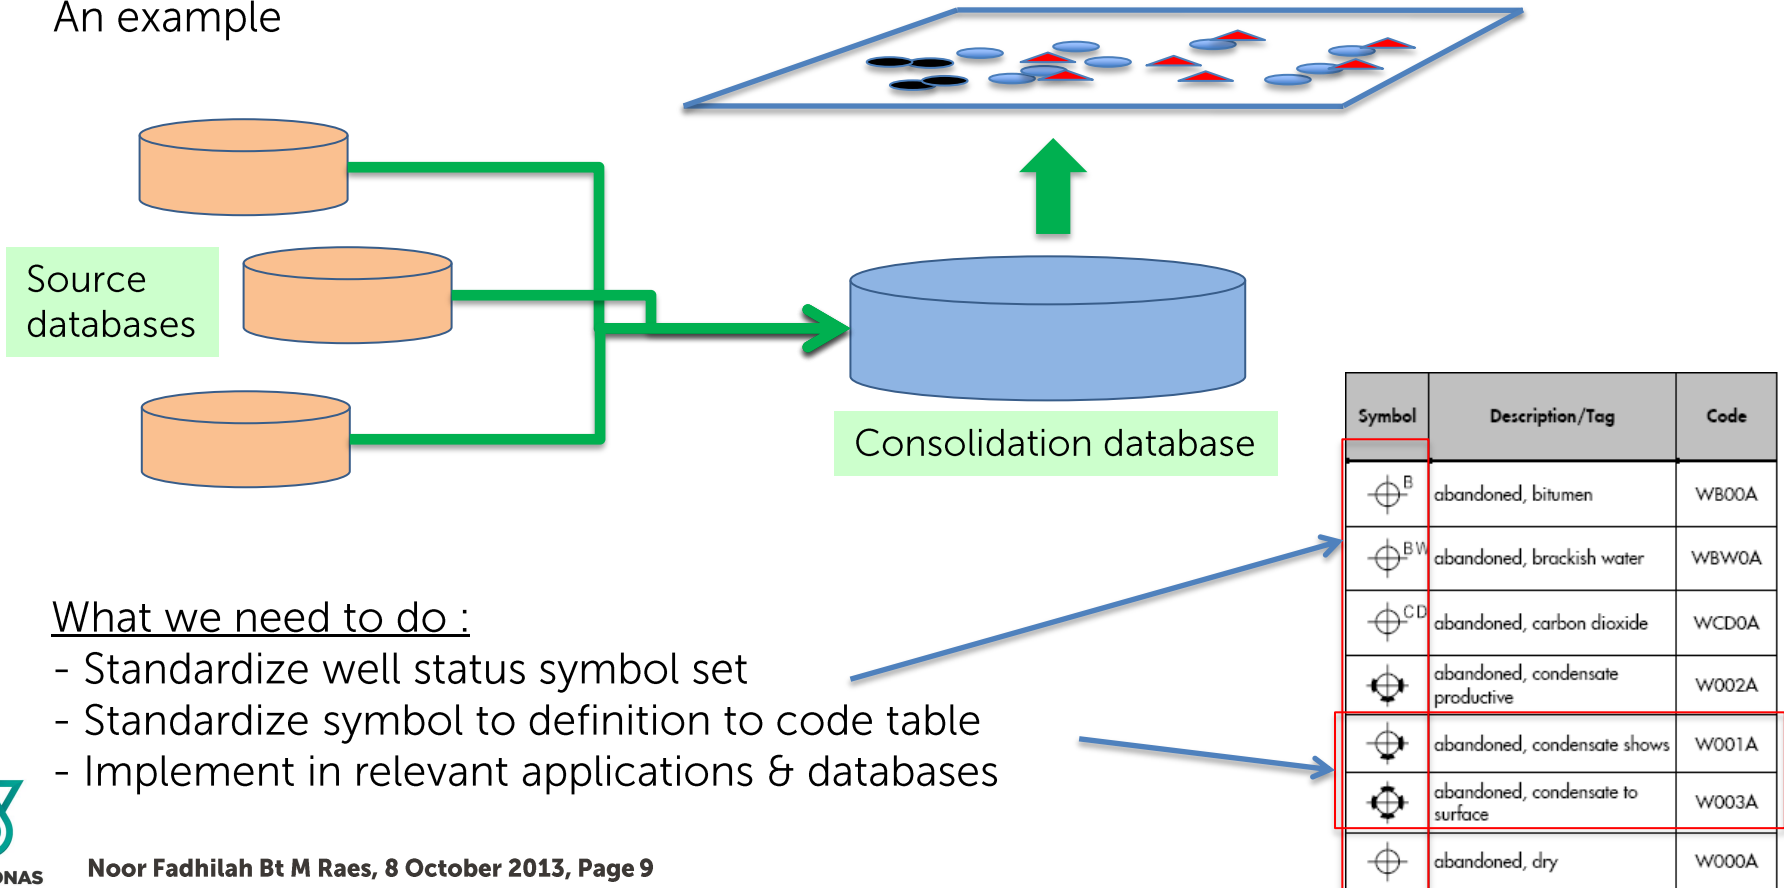

Business requirement :

Plotting of well status symbols across regional projects. Medium to large scale geological reviews require rapid compilation of data from various sources into a working area and map view.

Current issues :

An example

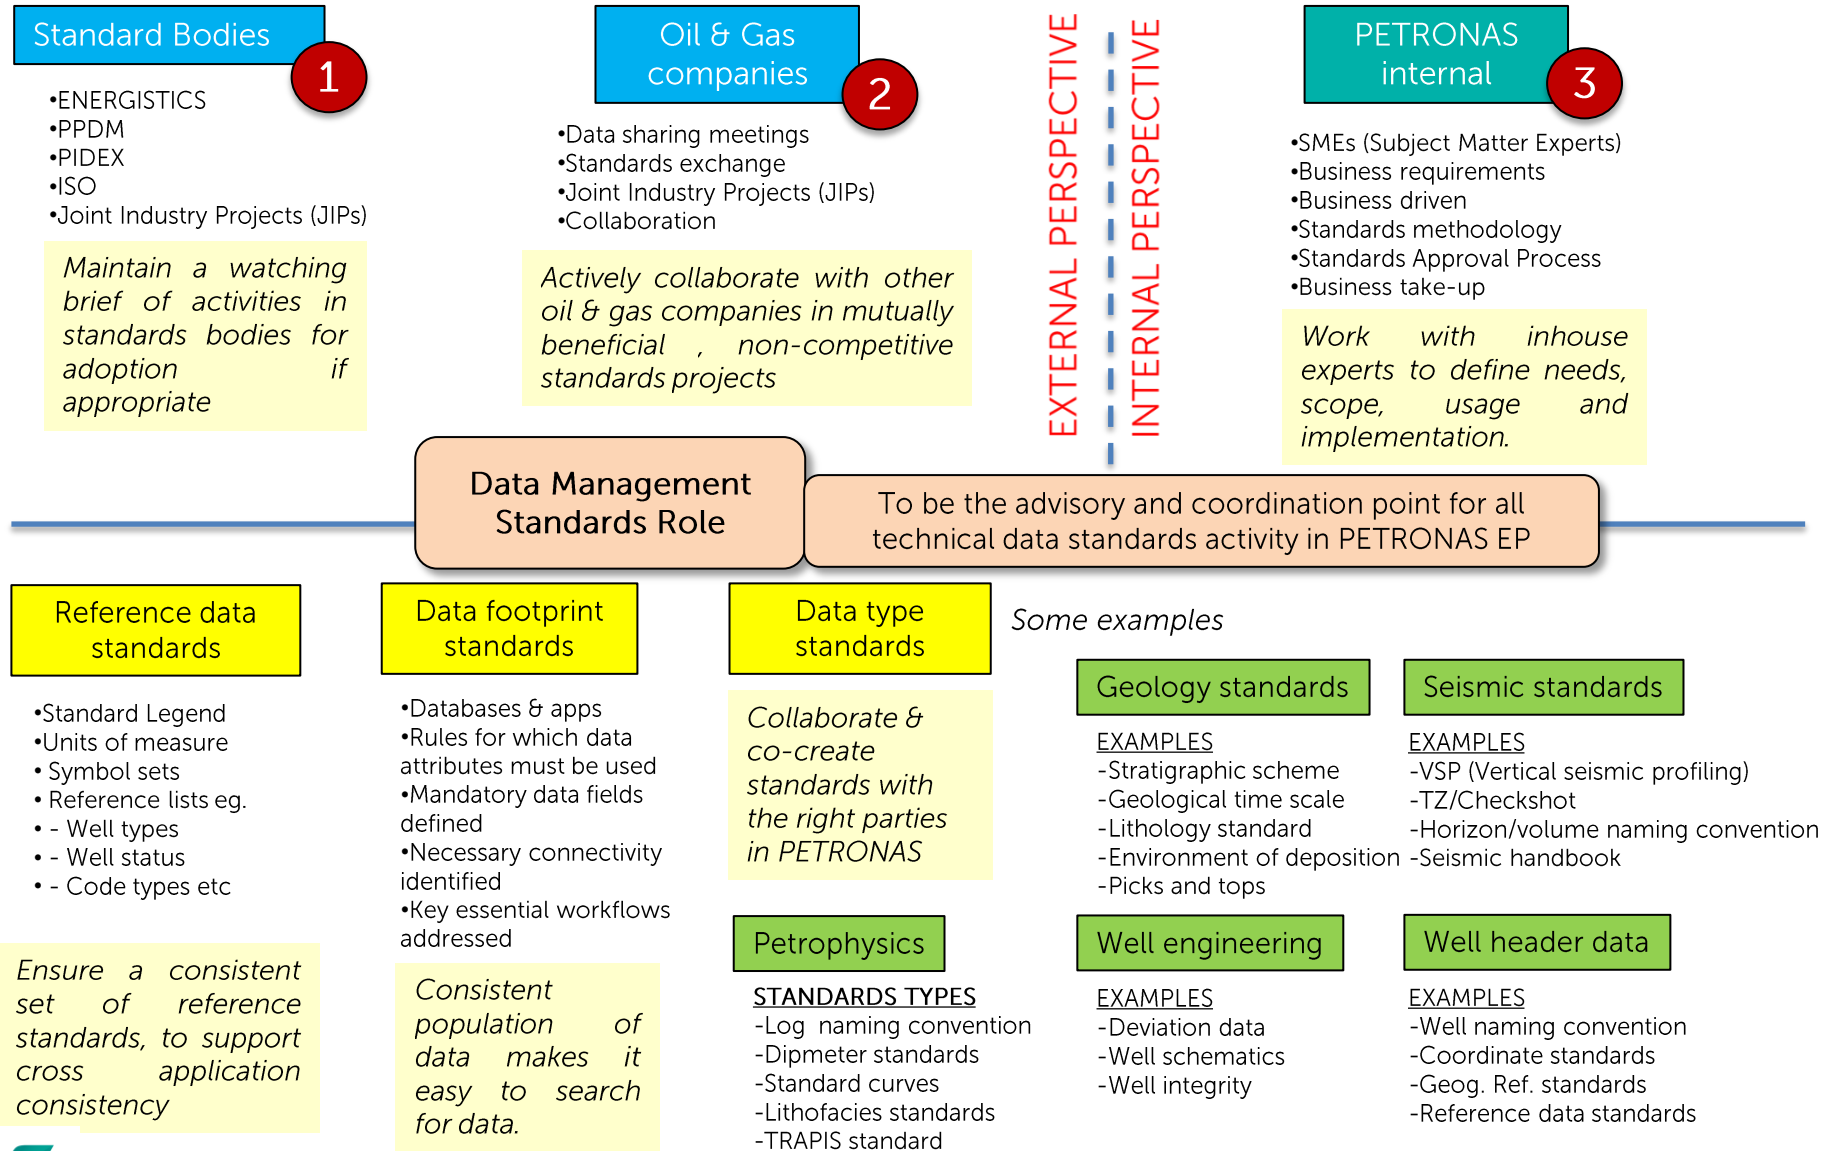

- Inconsistent symbols across projects
- Inconsistent for same wells in different projects

What we need to do :

- Standardize well status symbol set
- Standardize symbol to definition to code table
- Implement in relevant applications & databases

Data management standards role - relationships

Standards bodies for EP

Scalable pipeline database architecture with geospatial location

<https://www.posccaesar.org/>

Standards for enabling the interoperability of data, software and related matters

<https://www.ppdm.org/>

The Professional Petroleum Data Management (PPDM) Association

<http://www.seg.org/seg>

Society of Exploration Geophysicists

Moving the organization towards standards

START

- Opportunities
- Constraints encountered
- Restrictions to business improvement

Agree the need

- Competitive intelligence
- Benchmarking
- Conferences
- Standards bodies

Check pulse of the industry

- Clarity of issues
- Impact of non-standards
- Mapping
- Workflow connectivity

Develop the project scope

- Standards bodies
- Vendor applications
- Sharing with IOCs and NOCs

Adopt if possible

NO

YES

Adapt for use

Assimilate

Develop if necessary

- Inhouse experts
- Standards body
- Vendors
- Consultants

Implement the standard

- Applications/Databases
- Project management
- Phased plan
- Legacy issues

Monitor usage and value

- Monitoring tool
- Breakdown in workflows
- Business improvements
- Time saved etc

Update as required

- Identified deficiencies
- Changes to existing
- Redundant items

END

The Triple A approach

ADOPT

For any data standards required, look first outside PETRONAS

- 1) Standards Bodies
- 2) Oil & Gas companies
- 3) Service providers

ADAPT

Identify all the areas where the standard is applicable and develop plan for implementation.

Get internal stakeholder buy-in, go through the approval process. Endorse for use.

"Adapt" may require working jointly to make it usable

ASSIMILATE

Agree priority. Proceed with implementing in key applications and databases.

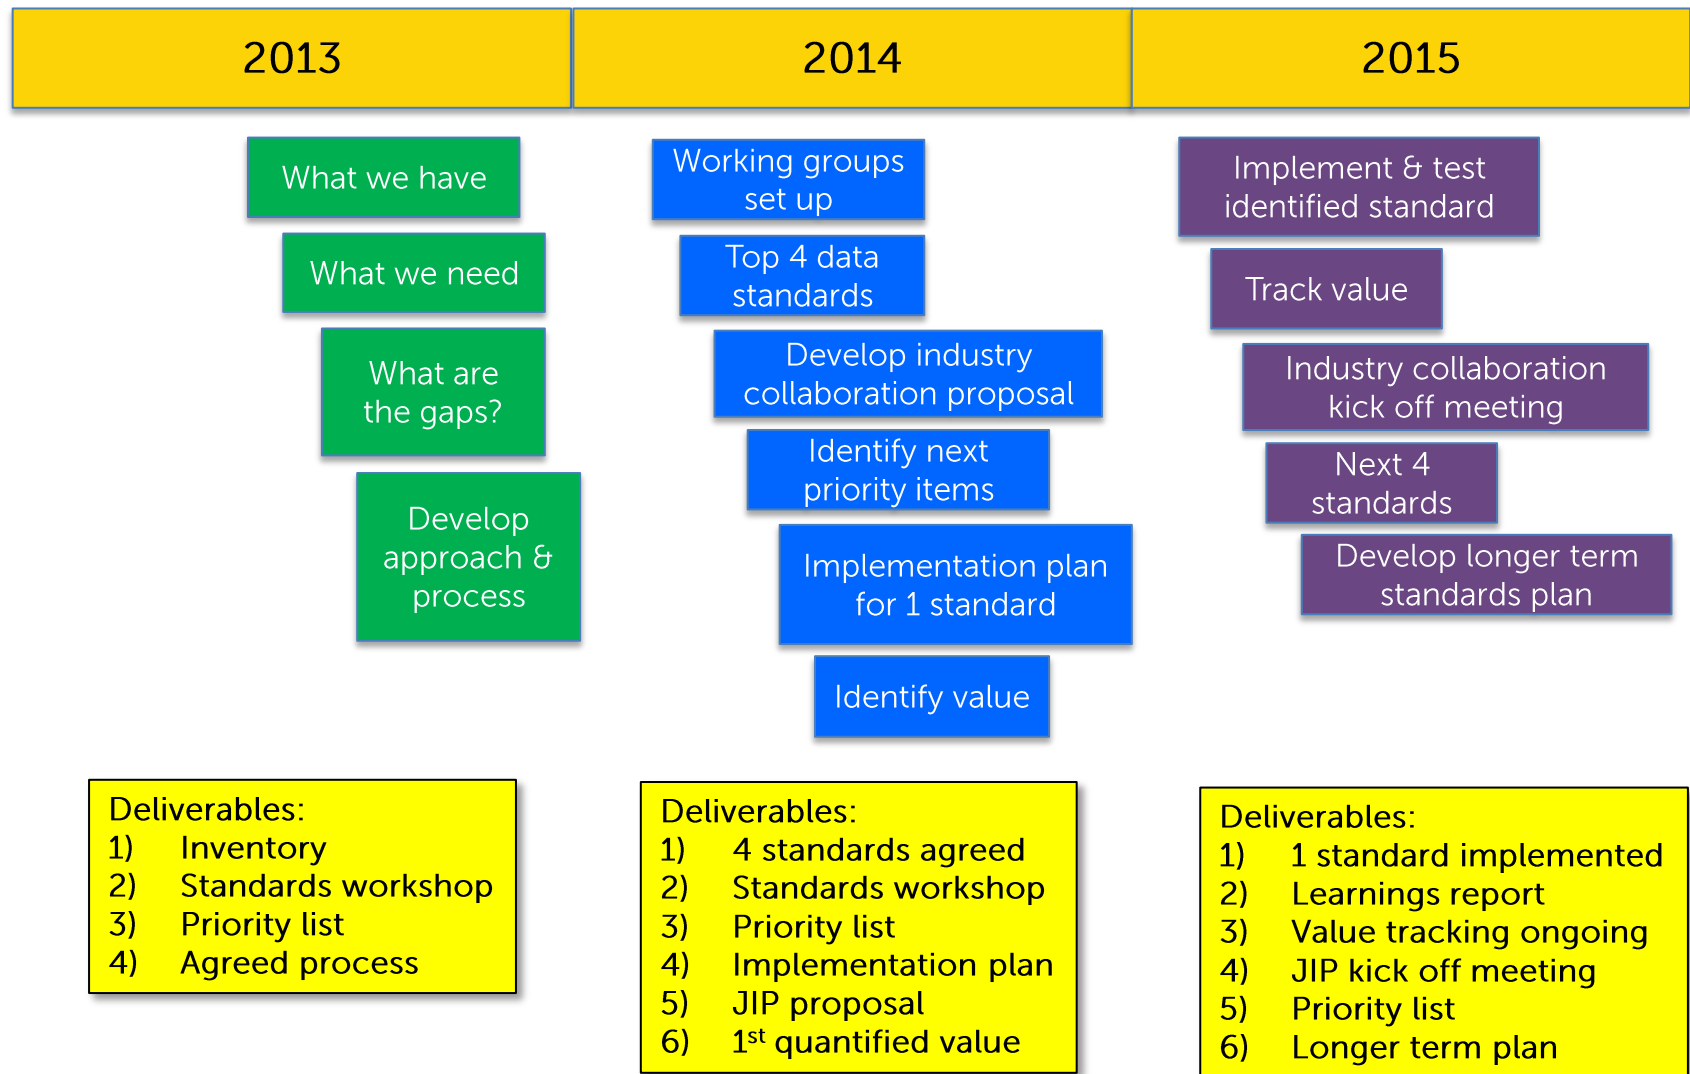

Develop plan to address legacy issues.

Implement compliance metrics for the implemented standard(s).

Improve over time.

Technical data standards - high level roadmap

Conclusion

- Technical data standards is a huge area
 - *Therefore prioritization and a phased plan are essential elements*
- Standards are non-competitive
 - *Therefore it makes sense to collaborate, share, use and re-distribute*
- Sustainability is high on our priority list
 - *Hence standards compliance tracking will be a core part of our approach*

PETRONAS

Thank You

Paper Abstract

Data standards are an essential component of the data management challenge in any organization. This is especially true in an upstream E&P organization where the cost of data acquisition is significant and the data entropy effect is high. Much of the value of data is derived in workflows, reusability and sustainability. However, the creation of good data standards is not easy. It is not exciting, with no quick short term gains, it is tedious, requires meticulous checking of dependencies within the organization as well as knowledge of the availability of similar work outside the organization. Very often, this work is also not well recognized.

With the recent creation of a Technical Data Division with PETRONAS E&P, data standardization is given due recognition as an important part of the Technical Data Management Framework. This paper describes the phased approach that is now being followed to address this gap and to build up PETRONAS E&P's data management capability for the longer term.
